

pthread.h - API

**pthread\_create()**

- to create and assigns the method to the respected thread
- Parameters
  - Thread id/name
  - Parameters to thread
  - Method name
  - Parameters / Arguments to the method

**pthread\_join()**

- It ensures that main() it self not completes before the thread
- If not join then it can happen that while threads are busy executing respected methods assigned to them, main will complete the execution and terminate the program.
